Abstract

This article describes one new species, *Sinophasma damingshanensis* sp. n. from Guangxi, China.

Key Words

Stick Insects
Necrosciini
Taxonomy
Damingshan
Mainland China
Oriental Region

Introduction

The genus *Sinophasma* Günther, 1940 is mainly distributed over China and Taiwan (Shiraki 1935; Otte and Brock 2005; Hennemann et al. 2008; Chen and He 2008; Ho 2012; Huang 2013). *S. vietnamense* Chen & Chen, 1999 from North Vietnam is the only species known from outside China and Taiwan. Currently twenty-six species and two subspecies are recognized in this Palaearctic and Oriental genus. The major revisionary work was provided by Chen and He (2008) and a revised key was provided by Ho (2012). The author recently conducted a collecting trip to Damingshan, located at the south-central Guangxi, China, and discovered a new species, *S. damingshanensis* sp. n., described and illustrated in this study.

Material and methods

The specimen was collected directly by hand at night due to their nocturnal behavior. A hand torch was used to spot them on the plants. The type specimens of *Sinophasma damingshanensis* sp. n. are deposited in Hong Kong Entomological Society (HKES). Morphological terms largely follow Bragg (2001) and Zompro (2004).

Results

*Sinophasma* Günther, 1940

http://species-id.net/wiki/Sinophasma

*Sinophasma* Günther, 1940: 240.

**Type species:** *Sinophasma klapperichi* Günther, 1940, by original designation.
Notes: While only one species occurs in Vietnam, all other twenty-five species and two subspecies are endemic to China.

**Sinophasma damingshanensis** Ho, sp. n.

Figures 1–6

**Description:** Male. Medium-sized. General colour of body, wings and legs green. Body slender and slim.

Head green, with six blackish longitudinal stripes reaching hind margin of head. Smooth, lacking granulation. Oval, longer and broader than pronotum, slightly constricted behind eyes posteriorly. Vertex flat, with an oval and shallow depression between bases of antennae. Occiput convex, with distinct median furrow, lateral furrows indistinct. Compound eyes light brown, rounded and prominent, about 1.5 times length of genae. Antennae dark brown, densely covered with setae; filiform, longer than forelegs; first segment flattened at base, rectangular, parallel-sided, about 1.5 times length of second segment, shorter than third segment; second and third segments cylindrical.

Pronotum rectangular, transverse and longitudinal sulci crossing before middle, anterior margin curved inward, hind margin slightly rounded. Mesonotum densely granulated, elongate, more than 4 times length of genae. Antennae dark brown, densely covered with setae; filiform, longer than forelegs; first segment flattened at base, rectangular, parallel-sided, about 1.5 times length of second segment, shorter than third segment; second and third segments cylindrical.

Abdomen dorsally green with brownish markings, ventral surface yellowish green. Smooth. Cylindrical and slender. Second to six terga parallel-sided, roughly equal in length. Seventh tergum gently expanded posteriorly. Eighth tergum trapezoid, gradually expanded posteriorly. Ninth tergum elongate and swollen, the longest, distinctly constricted medially, hind margin deeply emarginated; posterolateral angles elongate distinctly, apices obtuse; lateral margins raised. Anal segment rectangular, with a small horn mediadally; with ninth tergum vertically, longer than eighth tergum, reaching hind margin of anal segment; hind margin with four small emarginations, lateral angles elongate tuberculately. Poculum cup-shaped, hind margin rounded and broad. Cerci long and straight, cylindrical, apices rounded, not surpassing end of anal segment.

Tegmina brownish black, elevated angle blunt, with a yellow longitudinal stripe being laterad of elevation; oval, slightly as long as head, subtruncate posteriorly. Alae green, with dark brown longitudinal band, anal region dull rose; long, reaching posterior region of sixth tergum.

Female. Similar to male, but distinctly larger and robust. General colour of body, wings and legs green. Body slender and cylindrical.

Head greenish brown to light brown, occiput with six black longitudinal bands segregated by light brown longitudinal stripes. Smooth. Oval, distinctly longer than wide. Vertex flat, with a small oval depression between bases of antennae, its diameter as long as second antennal segment. Occiput distinctly convex, with median and lateral furrows. Compound eyes light brown, oval, about 2.5 times length of genae. Antennae dark brown, filiform, longer than forelegs; first segment slightly flattened at base, about 1.8 times length of second segment, as long as third segment.

Pronotum green, shorter than head, gently expanded posteriorly, with transverse and longitudinal sulci crossing before middle, anterior margin curved inward, hind margin truncate. Mesonotum green, densely covered with yellow and small granules; about 4 times length of pronotum, median line indistinct. Mesopleura, mesosternum, metapleura and metasternum densely granulated as in mesonotum. Metanotum smooth, longer than median segment.

Figures 1–2. Habitus images of *Sinophasma damingshanensis* sp. n. 1. Male, lateral view; 2. Female, lateral view.

Figures 3–6. *Sinophasma damingshanensis* sp. n. from Guangxi, China. 3. Male, terminal end of abdomen, lateral view; 4. Male, terminal end of abdomen, dorsal view; 5. Female, terminal end of abdomen, lateral view; 6. Female, terminal end of abdomen, dorsal view. [scale bar = 5 mm].

Tegmina brownish black, with light brown veins, elevated angle blunt, with a pale white longitudinal stripe being laterad of elevation; oval, longer than head, hind margin truncate. Alae green with dark brown longitudinal band, anal region dull rose; long, reaching middle of fifth tergum.

**Measurements.** Length (mm): Holotype: ♂, body length 52.0, antennae 41.0, head 3.0, pronotum 2.0, mesonotum 9.5, metanotum including median segment 7.5, profemora 14.0, mesofemora 10.0, metafemora 15.0, protibiae 12.0, mesotibiae 9.0, metatibiae 14.0. Paratypes: ♂, body length 51.0–52.0, antennae 34.0–36.0, head 3.0–3.5, pronotum 2.0–2.2, mesonotum 9.5, metanotum including median segment 7.0, profemora 12.5–13.0, mesofemora 9.0–10.0, metafemora 14.0, protibiae 11.0–12.0, mesotibiae 9.0, metatibiae 13.0–14.0, tegmina 2.5–3.0, alae 22.0–25.0. Paratypes: ♀, body length 59.0–73.0, antennae 34.0–36.0, head 3.0–3.5, pronotum 2.0–2.2, mesonotum 9.5, metanotum including median segment 7.0, profemora 11.0–15.0, mesofemora 8.0–10.0, metafemora 12.0–15.0, protibiae 9.0–14.0, mesotibiae 7.0–9.0, metatibiae 10.0–14.0, tegmina 3.5–4.5, alae 25.0–28.0.

**Etymology:** This species is named after the type-locality, Damingshan.

**Distribution:** Guangxi, China.

**Notes:** This species is found in evergreen broadleaf forests.

**Differentiation:** Small Sinophasma species. This new species is separated from most species in the genus by its rectangular anal segment with a small horn medially in male and seventh sternum lacking preopercular organ in female. S. damingshanensis Ho, sp. n. [Guangxi, China] is related to S. unispinosum Chen & Chen, 1997 [Guangdong, China] but can be separated by its greenish colour, smaller size and slenderer body in both sexes; absence of preopercular organ and decurved subgenital plate in female; and posterolaterally tuberculate anal segment in male.

**Acknowledgements**

The author is grateful to the staff of Damingshan Nature Reserve, Guangxi for their kind assistance and the anonymous reviewers for providing valuable comments to improve the manuscript.
