Abstract

The world species of the genus *Exoryza* (Hymenoptera, Braconidae, Microgastriniae) are revised. Ten species are recognized, including five new, authored by Fernandez-Triana: *mariabustosae*, *richardashleyi*, *ritaashleyae*, *rosamatarritae* and *yeimycedenoae*. The species *Dolichogenidea oryzae* Walker, 1994 is considered as related to *Exoryza* – although is not formally transferred to that genus. A dichotomous key to all species, descriptions and illustrations are provided. The only region where the genus is not yet recorded is Australasia, but this may be a collecting artifact. Host caterpillars (Lepidoptera) include species within Choreutidae, Depressariidae, Gelechiidae, and Pyraloidea – all but Pyraloidea are new host records. The status of *Exoryza* is questioned (it may only represent a species-group within the genus *Dolichogenidea*) but it is retained as a valid genus until a comprehensive phylogenetic study of Microgastriniae is available.

DNA barcoding

Introduction

The braconid subfamily Microgastriniae contains more than 60 genera (Yu et al. 2012), many of them lacking comprehensive revisions and keys to their species. *Exoryza* is a rarely collected genus (Mason 1981, Valerio et al. 2004), and it is poorly represented in collections. It was described by Mason (1981) to include two species of Apantelini (*sensu* Mason 1981) with broad and heavily sculptured metasomal tergites 1–2, and a coarsely rugose and areolate propodeum. Three other species have since been described (Song and Chen 2003, Valerio et al. 2004, Rousse and Gupta 2013), expanding the known distribution of the genus to all continents but Australia.

Here we review *Exoryza*, as it occurs in Area de Conservación Guanacaste (ACG), northwestern Costa Rica (Janzen et al. 2009, Janzen and Hallwachs 2011), as part of comprehensive studies of ACG Microgastriniae (e.g., Fernandez-Triana et al. 2014). Five new species are described, and a key to the known *Exoryza* of the world is provided.

Methods

Most of the specimens studied were Malaise-trapped or reared in ACG, and a few additional specimens were available in the Canadian National Collection of Insects (CNC) in Ottawa, Canada. Five species of *Exoryza* had been described previously; we were able to examine the holotypes of *E. minnesota* and *E. monocavus*, but the original descriptions and illustrations of the rest were sufficiently detailed to allow description of the new species with confidence.
The following institution acronyms are used:

BMNH  The Natural History Museum, London, United Kingdom
FAFU  Fujian Agriculture and Forestry University, Fujian, China
INBio  Instituto Nacional de Biodiversidad, San José, Costa Rica
MNHN  Muséum National d’Histoire Naturelle, Paris, France
NMNH  National Museum of Natural History, Washington DC, United States.

Morphological terms, measurements of structures, and body ratios are mostly used as by Mason (1981), Huber and Sharkey (1993), Whitfield (1997), Karlsson and Ronquist (2012), and Fernández-Triana et al. (2014). Metapleural tergites 1, 2, etc., are abbreviated as T1, T2, etc.; ocular occellar line as OOL, and posterior occellar line as POL. The diagnostic descriptions include characters that are commonly used in describing Microgastrinae (e.g., body measurements such as length of body, fore wing and ovipositor sheath, hind wing vannal lobe shape and fringe, and color of particular body areas). The dichotomous key and descriptions of the new species are based on the study of all available female specimens, to assess intraspecific variation. Body measurements shown are mostly from the holotype specimens. Whenever possible, information on additional female specimens was also included, between parentheses after the holotype data; the voucher codes of those specimens are provided under ‘Paratypes’ in the corresponding description of each species. Males were not studied morphologically, as most species can only be readily identified by association with females via rearing or molecular data.

Photos were taken with a Keyence VHX-1000 Digital Microscope, using a lens with a range of 13–130×. Multiple images through the focal plane were taken of a structure and these were combined to produce a single in-focus image, using the software associated with the Keyence System.

Together with morphological studies, we also analyzed DNA barcodes (the 5' region of the cytochrome c oxidase I (CO1) gene, Hebert et al. 2003) whenever available. DNA barcodes were obtained using DNA extracts prepared from single legs using a glass fibre protocol (Ivanova et al. 2006). Briefly, total genomic DNA was re-suspended in 30 μl of dH2O, and a 658-bp region near the 5’ terminus of the CO1 gene was amplified using standard primers (LepF1–LepR1) following established protocols (Smith et al. 2006, 2007, 2008). If the initial 658 bp amplification was unsuccessful, smaller sequences were generated using internal primers. If each amplification was successful, a composite sequence was generated. However in cases where only one read amplified, this shorter sequence was used. A neighbor-joining (NJ) tree based on Kimura 2-parameter to visually demonstrate the variation present within and between each species in the DNA barcode locus is presented in Figure 40. All information for the sequences (including GenBank accession numbers) associated with each individual specimen can be retrieved from the Barcode of Life Data System (BOLD) (Ratnasingham and Hebert 2007) using the persistent DOI dx.doi.org/10.5883/DS-ASEXORYZ [requested April 15, 2016 but not yet active].

The new ACG species described below received patronyms honoring the teachers and supporters of a biodiversity conservation event and school child nature awareness competition, conducted by the Programa de Educación Biológica (PEB) of ACG in the last half of 2015 (Kazmier 2015).

Results

Diagnosis and status of *Exoryza*

**Diagnosis.** Heavily sculptured and broad T1 and T2 (usually with strong longitudinal striation); T2 rectangular or nearly so, as long as or longer than T3 (Figs 5, 12, 18, 24, 31, 38); fore wing without areolet; vannal lobe straight to concave, uniformly fringed by setae (Figs 4, 11, 17, 35); propodeum sculptured and with areola (but sometimes areola obscured by other sculpture) (Figs 4, 11, 17, 18, 23, 24, 30, 37). The uniformly setose vannal lobe separates *Exoryza* from *Apanteles*, while the sculpture of T1 and T2 distinguishes *Exoryza* from *Dolichogenidea* (but see below).

The status of *Exoryza* as a valid genus has been questioned by many authors (e.g., Valerio et al. 2004, Rousse and Gupta 2013, Fernandez-Triana et al. 2014). Mason (1981) characterized *Exoryza* as having T1 and T2 heavily sculptured, and propodeum coarsely rugose (with areola present but obscured by propodeum sculpture). The distinction between it and *Dolichogenidea* is particularly difficult (e.g., Fernandez-Triana et al. 2014), since many species of *Dolichogenidea* have a sculptured propodeum (with or without areola), and T1 is occasionally sculptured (although not as strongly as in *Exoryza*). T2 is also more or less broadly trapezoidal in shape in *Exoryza*, without the more or less sinuate hind margin many *Dolichogenidea* species have. All known sequences (DNA barcodes) of *Exoryza* cluster together in a NJ tree containing more than 50 genera and 17,518 sequences of world species of Microgastrinae (see Appendix S2 in Smith et al. 2013, page 41, sequences 4019–4041); but they are within a larger cluster containing *Dolichogenidea* (and a few specimens of *Parapanteles* and *Apanteles* which were most likely misidentified and are actually *Dolichogenidea*). With no recent, comprehensive phylogenetic study of Microgastrinae available, we consider it best to maintain *Exoryza* as a valid genus for the time being.
Diversity and host data

Five species of *Exoryza* were previously known (Mason 1981, Song and Chen 2003, Valerio et al. 2004, Rousse and Gupta 2013), and five new species are described below for a total of 10 species worldwide. *Dolichogenidea oryzae* Walker, 1994 could probably be included within *Exoryza* as well –based on the examined specimens (including holotype), host data (*Chilo* spp.) and distribution (West Africa), that species fits well within the generic concept used in the present paper. However, we have refrained from transferring *D. oryzae* to *Exoryza* due to the possibility that in the future *Exoryza* becomes a synonym of *Dolichogenidea* –see comments in previous paragraphs. But we include *D. oryzae* in the dichotomous key for *Exoryza* species provided below.

*Exoryza* seems to be almost cosmopolitan, with one species recorded from the Nearctic, six Neotropical, one Afrotropical, one Oriental, and one species found in both the Oriental and Eastern Palaearctic regions (Table 1). So far the only region where the genus has not been recorded is Australasia, but this may be a collecting artifact. We anticipate that additional species will be found as more collecting and study of world collections advances.

Only one of the five previously described species, *E. schoenobii* (Wilkinson), had associated host data. It was reared from five species of Lepidoptera within four genera of Pyraloidea (Yu et al. 2012). That wasp species has been rather extensively studied as a biocontrol agent of stem-boring Lepidoptera in rice fields in Asia (see compilation of references in Yu et al. 2012). Here we report additional hosts species for *Exoryza*, all based on rearing from small leaf-rolling and leaf-silking caterpillars in ACG (Janzen et al. 2009): Choreutidae (‘*Brenthia Janzen05*’), several species of Gelechiidae (subfamily Dichomeridinae, with interim names ‘gelJanzen01 Janzen16’, ‘gelJanzen01 Janzen319’, ‘gelJanzen01 Janzen349’), and Depressariidae (‘*Stenoma Phillips543*’).

Table 1. World species of *Exoryza*. Geographical distribution and associated host data from Yu et al. (2012) and the present paper.

Key to known species of *Exoryza* and *Dolichogenidea oryzae* (see text for explanation about inclusion of the *Dolichogenidea* species).

1 Basal tergites reddish-yellow, metasoma mostly yellow; ovipositor sheaths 0.7 x as long as metatibia [China] .........................
   - Basal tergites black, metasoma mostly dark brown to black (Figs 5, 12, 18, 24, 31, 38); ovipositor sheaths usually as long as or longer than metatibia length........................................................................................................... 2
2(1) Metacoxa and metasternum entirely black; ovipositor sheaths almost twice as long as metatibia [Réunion island].........
   - Metacoxa and metafemur entirely black; ovipositor sheaths much shorter (0.7–1.5 x as long as metatibia).... 3
3(2) T1 strongly broadening towards posterior margin (Figs 3, 5), its length 0.8–1.0 x its width at posterior margin, and its width at anterior margin 0.5–0.7 x its width at posterior margin; propodeum area mostly obscured by surrounding heavy sculpture (Figs 4, 5); metapleuron entirely sculptured [Old World tropics]................................................................. 4
   - T1 less strongly broadening towards posterior margin (Figs 12, 18, 24, 31, 38), its length at least 1.1 x its width at posterior margin (usually more) and its width at anterior margin 0.8–0.9 x its width at posterior margin; propodeum area clearly marked by carinae (Figs 11, 17, 18, 23, 24, 30); metapleuron mostly smooth [New World].... 5
4(3) Mesopleuron mostly smooth (Fig. 6); metafemur length 2.9 x metatibia length (Fig. 6); malar line 0.9 x mandible width (Fig. 1); ovipositor sheaths 0.7 x metatibia length [Afrotropics: Gambia, Ivory Coast, Niger, Senegal]....
   - Metacoxa and metafemur entirely to partially yellow; ovipositor sheaths much shorter (0.7–1.5 x as long as metatibia).... 3
5(3) T1 barrel-shaped, with lateral margins convex; metapleuron with medial pit present but not conspicuously deep or evident [Nearctic: USA and Canada] ................................................................................................................................................................................................. 5
   - T1 parallel-sided to slightly widening towards posterior margin, with lateral margins straight (Figs 12, 18, 24, 31, 38); metapleuron with a conspicuously deep central pit [Nearctic: Costa Rica].................................................. 6
6(5) Body length 2.3–2.5 mm; metatibia dark brown to black on posterior 0.5–0.7 (Figs 13, 32)........................................ 7
   - Body length 3.1–3.8 mm; metatibia dark brown to black on posterior 0.1–0.2 (Figs 19, 25, 39).......................... 9
7(6) Flagellomere 16 length 2.5 x flagellomere 15 length; ocellar occular line 1.4 x posterior ocellar line; metafemur length 3.4 x its width; metatibia dark brown to black on posterior 0.5 [Costa Rica: Puntarenas, at 1,000–1,035 m]..........
   - Flagellomere 16 length 1.2 x flagellomere 15 length; ocellar occular line 1.0–1.1 x posterior ocellar line; metafemur length 3.6–3.8 x its width; metatibia dark brown to black on posterior 0.6–0.7 [Costa Rica: ACG, mostly collected at 500–600m]........................ 8
8(7) T3 entirely smooth (Fig. 12); T1 and T2 mostly with longitudinally striated sculpture (Fig. 12); tarsal claws of hind legs with single spine-like basally ...................................................... Exoryza mariabustosae Fernandez-Triana, sp. n.
   - T3 sculptured on anterior 0.2–0.5 (but mostly centrally) (Fig. 31); T1 and T2 mostly with reticulate sculpture (Fig. 31); tarsal claws of hind legs simple .................................. Exoryza rosatarnita Fernandez-Triana, sp. n.
9(6) Pterostigma with pale yellow spot on proximal 0.5 (Fig. 16); smaller species (body length 3.1 mm and fore wing length 3.4 mm); thinner metafemur (4.1 x as long as maximum width) (Fig. 19)........................................ Exoryza richardashleyi Fernandez-Triana, sp. n.
   - Pterostigma mostly brown, at most with small pale spot on proximal 0.1–0.2 (Figs 22, 36); larger species (body length 3.3–3.8 mm and fore wing length 3.5–4.1 mm); thicker metafemur (3.6–3.8 x as long as maximum width) (Figs 25, 39)......................................................................................................................... 10
10(9) Metatibial spurs with brown tips; flagellomere 2 length 2.1 x flagellomere 14 length................................................. Exoryza yeimycedenoae Fernandez-Triana, sp. n.
   - Metatibial spurs entirely yellow; flagellomere 2 length 2.5 x flagellomere 14 length........................................ Exoryza ritaashleyae Fernandez-Triana, sp. n.

**Taxonomic treatment of species**

**Dolichogenidea oryzae** Walker, 1994

Figs 1–6

Other specimens examined. 1 #F (CNC), Republic of the Gambia, Bakan, 19.i.1978, coll. L. Huggert. DNA voucher code: CNCHYM 01202.

Diagnostic description. Body color. Head (except for clypeus and mandibles), mesosoma and T1–T2 black,
Figures 1–6. Dolichogenidea oryzae.
remaining mediointergites brown; laterointergites, sternites and hypopygium yellow; antennal flaggellomeres brown; tegula and wing base yellow; pterostigma mostly brown (with small pale spot on proximal 0.1); legs mostly yellow-orange except for metacoxa (black on proximal 0.6, yellow-orange on distal 0.4), metatfemur (distal 0.2 dorsally brown), metatibia (distal 0.3 brown), and metatarsus (brown). **Body ratios.** Flagellomere 2 length/width: 3.2 x. Flagellomere 14 length/width: 2.0 x. Malar line/mandible width: 0.9 x. Metatfemur length/width: 2.9 x. Metatibial inner/outer spur length: 1.2 x. T1 length/width at posterior margin: 0.7 x. T2 length/width at posterior margin: 0.4 x. Ovipositor sheaths length/metatibia length: 0.7 x. **Body measurements (all in mm).** Body length: 3.2. Fore wing length: 3.4. Flagellomere 2 length/width: 0.26/0.08. Flagellomere 14 length/width: 0.13/0.065. Flagellomeres 1/2/3/14/15/16 length: 0.27/0.26/0.26/0.13/0.12/0.16. OOL: 0.15. POL: 0.13. Diameter of posterior ocellus: 0.07. Malar line/mandible width: 0.09/0.10. Metatfemur length/width: 0.75/0.26. Metatibia length: 1.08. First segment of metatarsus length: 0.51. Metatibial inner/outer spur length: 0.28/0.23. T1 length/width at anterior margin/width at posterior margin: 0.46/0.36/0.65. T2 length/width at posterior margin: 0.30/0.71. T3 length: 0.21. Ovipositor sheaths length: 0.75.

**Biology.** Reared from Pyraloidea (**Chilo diffusilineus** (de Joannis), **Chilo zacconius** Bleszynski, 1970) (Walker 1994).

**Distribution.** Gambia, Ivory Coast, Niger, Senegal.

**Notes.** All available evidence (morphology, biology) strongly suggests this species belongs to *Exoryza*. But we have not transferred the species to that genus due to the possibility that *Exoryza* is synonymized under *Dolichogenidea* in the future (see further discussion on the topic above). The diagnostic description provided above, as well as the pictures of the species were based on the female specimen deposited in the CNC. For more details, the original description of the species (Walker 1994) should also be consulted.

**Exoryza mariabustosae Fernandez-Triana, sp. n.**

http://zoobank.org/8C75D0A4-4EF7-4C82-8589-162345CD0428

**Paratypes.** 4 #M (CNC, NMNH). Costa Rica, Alajuela, ACG. DNA voucher codes: DHJPAR0051074, DHJPAR0051184, DHJPAR0052269, DHJPAR0052281.

**Diagnostic description.** **Body color.** Head (except for clypeus and mandibles), mesosoma and metasoma (dorsally) dark brown to black; laterotergites, sternites and hypopygium partially yellow, partially dark brown; antennal flaggellomeres dark brown; tegula and wing base white-yellow; pterostigma mostly brown (with small pale spot on proximal 0.1); legs mostly white-yellow except for metacoxa (black on proximal 0.7, white-yellow on distal 0.3), metatfemur (distal 0.1 dorsally brown), metatibia (distal 0.7 dark brown), and metatarsus (dark brown). **Body ratios.** Flagellomere 2 length/width: 3.1 x. Flagellomere 14 length/width: 1.3 x. Malar line/mandible width: 1.1 x. Metatfemur length/width: 3.6 x. Metatibial inner/outer spur length: 1.2 x. T1 length/width at posterior margin: 1.2 x. T2 length/width at posterior margin: 0.4 x. Ovipositor sheaths length/metatibia length: 0.9 x. **Body measurements (all in mm).** Body length: 2.5. Fore wing length: 2.7. Flagellomere 2 length/width: 0.23/0.075. Flagellomere 14 length/width: 0.09/0.07. Flagellomeres 1/2/3/14/15/16 length: 0.22/0.23/0.21/0.09/0.09/0.11. OOL: 0.12. POL: 0.11. Diameter of posterior ocellus: 0.065. Malar line/mandible width: 0.08/0.07. Metatfemur length/width: 0.72/0.20. Metatibia length: 0.82. First segment of metatarsus length: 0.41. Metatibial inner/outer spur length: 0.19/0.16. T1 length/width at anterior margin/width at posterior margin: 0.40/0.29/0.33. T2 length/width at posterior margin: 0.18/0.46. T3 length: 0.14. Ovipositor sheaths length: 0.70.

**Male.** As female but metacoxa and metatibia entirely dark brown to black, and T1–T2 narrower and smaller. Biology. Reared from Gelechiidae (an undetermined species with interim name ‘gelJanzen01 Janzen319’).

**Distribution.** Costa Rica, Alajuela and Guanacaste provinces, ACG (Sectors Pitilla, San Cristobal and Rincon Rain Forest), between 527–980m.

**Etymology.** Named in honor of María Margarita Bustos González for her enthusiasm in teaching her La Garita Vieja students to understand and protect the wild nature that occurs in her homeland.

**Exoryza minnesota Mason, 1981**

**Description.** Detailed descriptions and images of the species available in Mason (1981) and Valerio et al. (2004).

**Biolo**gy. Unknown.

**Distribution.** Canada (Ontario) and United States (Michigan) (Mason 1981, Valerio et al. 2004, Fernandez-Triana 2010).

**Comments.** Valerio et al. (2004) mentioned that the holotype of this species was in the CNC. However, the NMNH is the institution actually storing the type – see the original description for details (Mason 1981: 41).
**Exoryza monocavus** Valero & Whitfield, 2004

**Holotype.** Female, INBio (examined). COSTA RICA: Puntarenas, San Luis, Monte Verde, Buen Amigo, 1,000–1,350m, xi-1994, coll. Z. Fuentes de Luz, LN 250850–449250.

**Description.** A detailed description and images of the species are available in Valero et al. (2004).

**Biology.** Unknown.

**Distribution.** Known only from the holotype locality in Costa Rica.

**Exoryza reticarina** Song & Chen, 2003

**Description.** A detailed description of the species and images are available in Song and Chen (2003).

**Biology.** Unknown.

**Distribution.** Known only from the holotype locality in China.

**Exoryza richardashleyi** Fernandez-Triana, sp. n.

**Holotype.** Female, CNC. COSTA RICA: Guanacaste, Sector Cacao, Sendero Cima, 1,460m, 10.93328,-85.45729, 18.xii.2008, coll. D. Janzen & W. Hallwachs. DNA voucher code: DHJPAR0031500.

**Paratypes.** 3 #F (CNC, NMNH). Costa Rica, Guanacaste, ACG, same locality than holotype. DNA voucher codes: DHJPAR0034091, DHJPAR0034103, DHJPAR0034150.

**Diagnostic description.** **Body color.** Head (except for clypeus and mandibles), mesosoma and metasoma (dorsally) dark brown to black; laterotergites, sternites and hypopygium partially yellow, partially dark brown; antennal flagellomeres dark brown to black; tegula and wing base yellow-white; pterostigma mostly brown (with small pale spot on proximal 0.1); legs mostly yellow-white except for metacoxa (black on proximal 0.6–0.7, white-yellow on distal 0.4–0.3), metafemur (distal 0.1 dark brown), metatibia (distal 0.1 dark brown), and metatarsus (dark brown). **Body ratios.** Flagellomere 2 length/width: 3.2 x. Flagellomere 14 length/width: 1.5 x. Malar line/mandible width: 0.9 x. Metafemur length/width: 4.1 x. Metatibial inner/outter spur length: 1.1 x. T1 length/width at posterior margin: 1.1 x. T2 length/width at posterior margin: 0.4 x. Ovipositor sheaths length/metatibia length: 1.3 x (approximate value).

**Body measurements (all in mm).** Body length: 3.5–3.8. Fore wing length: 3.4. Flagellomere 2 length/width: 0.26/0.08. Flagellomere 14 length/width: 0.105/0.07. Flagellomeres 1/2/3/14/15/16 length: 0.27/0.26/0.25/0.10/0.15/0.14. OOL: 0.14. POL: 0.13. Diameter of posterior ocellus: 0.08. Malar line/mandible width: 0.09/0.10. Metafemur length/width: 0.95/0.23. Metatibia length: 1.10. First segment of metatarsus length: 0.51. Metatibial inner/outter spur length: 0.21/0.19. T1 length/width at anterior margin/width at posterior margin: 0.46/034/0.42. T2 length/width at posterior margin: 0.19/0.52. T3 length: 0.19. Ovipositor sheaths length: 1.50 (approximate value).

ellomere 2 length/width: 0.30/0.085. Flagellomere 14 length/width: 0.12/0.075. Flagellomeres 1/2/3/14/15/16 length: 0.29/0.30/0.30/0.12/0.11/0.15. OOL: 0.14. POL: 0.12. Diameter of posterior ocellus: 0.08. Malar line/mandible width: 0.11/0.10. Metafemur length/width: 0.98/0.27. Metatibia length: 1.25. First segment of meta-

tarsus length: 0.57. Metatibial inner/outer spur length: 0.26/0.25. T1 length/width at anterior margin/width at posterior margin: 0.52/0.35/0.42. T2 length/width at posterior margin: 0.22/0.58. T3 length: 0.21. Ovipositor sheaths length: 1.6–1.9.

**Male.** Unknown.
Biology. Unknown.

Distribution. Costa Rica, Guanacaste, ACG (Sector Cacao), 1,460m.

Etymology. Named in honor of Rita Ashley from Hua-
cas, Nicoya, for her serious enthusiasm for understanding
and protecting the wild nature that occurs all around her,
and specifically for causing 20 Guanacaste school chil-
dren and their teachers to begin to share that enthusiasm.

Figs 26–32

Holotype. Female, CNC. COSTA RICA: Alajuela, ACG, Sector San Cristobal, Finca San Gabriel, 645m, 10.878,
-85.393, 18.vi.2013, coll. C. Cano. DNA voucher code:
DHJPAR0053053.

Paratypes. 4 #F (CNC, NMNH). Costa Rica, Alajue-
la, ACG. DNA voucher codes: DHJPAR0033751,
DHJPAR0049364, DHJPAR0052979, DHJPAR0053807.

Diagnostic description. Body color. Head (except
clypeus and mandibles), mesosoma and metasoma (dorsally) dark brown to black; laterotergites, sternites
and hypopygium partially yellow, partially dark brown;
antennal flagellomeres dark brown; tegula and wing base
white-yellow; pterostigma mostly brown (with small
pale spot on proximal 0.1); legs mostly white-yellow
except for metacoxa (black on proximal 0.8, white-yel-
on on distal 0.2), metafemur (distal 0.2 dorsally brown),
metatibia (distal 0.6 dark brown), and metatarsus (dark
brown). Body ratios. Flagellomere 2 length/width: 3.1 x. Flagellomere 14 length/width: 1.3 x. Malar line/
mundible width: 1.0 x. Metafemur length/width: 3.7 x. Metatibial inner/outer spur length: 1.1 x. T1 length/
width at posterior margin: 1.1 x. T2 length/width at posterior
margin: 0.5 x. Ovipositor sheaths length/metatibia
length: 0.8 x. Body measurements (all in mm). Body
length: 2.5 (2.3–2.8). Fore wing length: 2.7 (2.4–2.8).
Flagellomere 2 length/width: 0.22/0.07. Flagellomere 14
length/width: 0.09/0.07. Flagellomeres 1/2/3/14/15/16
length: 0.21/0.21/0.21/0.09/0.09/0.11. OOL: 0.11. POL:
0.10. Diameter of posterior ocellus: 0.06. Malar line/
mundible width: 0.09/0.09. Metafemur length/width:
0.66/0.18 (0.65/0.17; 0.74/0.20). Metatibia length: 0.82
(0.82; 0.94). First segment of metatarsus length: 0.41
(0.41; 0.42). Metatibial inner/outer spur length: 0.18/0.16
(0.20/0.18). T1 length/width at anterior margin/width
at posterior margin: 0.38/0.28/0.35. T2 length/width
at posterior margin: 0.21/0.42. T3 length: 0.18. Ovipositor
sheaths length: 0.6–0.8.

Male. Unknown.

Biology. Reared from Choreutidae (‘Brenthis
Janzen05’), Depressariidae (‘Stenoma Phillips543’), and
Gelechiidae (an undetermined species with interim name
‘genuine01 Janzen16’).

Distribution. Costa Rica, Alajuela, ACG (Sector San
Cristobal), 540–645m.

Etymology. Named in honor of Rosa Iris Matarrita
Diaz for her enthusiasm in teaching her Colonia Bolaños
students to understand and protect the wild nature that
occurs in her homeland.

Exoryza schoenobii (Wilkinson, 1932)

Exoryza schoenobii (Wilkinson, 1932): 142. Original de-
scription.

Holotype. Female, BMNH (not examined). INDIA: ‘South India, Hebbal Farm’.

Description. Detailed descriptions of the species and
images are available in Mason (1981) and Valerio et al.
(2004).

Biology. Reared from Pyraloidea (Chilo polychrysa,
C. supressalis, Glaucocharis reniella, Schoenobius bi-
punctifer, and Scirpophaga incertulas) (Yu et al. 2012).

Distribution. Bangladesh, China (Fujian, Guangdong,
Guangxi, Guizhou, Hainan Island, Hubei, Hunan, Jiang-
su, Jiangxi, Sichuan, Taiwan, Yunnan, Zhejiang), India,
Malaysia, Philippines, Sri Lanka, Vietnam (references
summarized in Yu et al. 2012).

Comments. Although the holotype was not examined,
we studied two CNC specimens that were compared with
the holotype by Mason (Mason 1981, Valerio et al. 2004).

Exoryza safranum Rousse & Gupta, 2013

Holotype. Female, MNHN (not examined). REUNION:

Description. A detailed description of the species and
images are available in Rousse and Gupta (2013).

Biology. Unknown.

Distribution. Known only from the holotype locality in
Réunion.

Comments. This species was collected with a light trap.

Exoryza yeimycedenoae Fernandez-Triana, sp. n.
http://zoobank.org/D659373B-3BF5-4E7F-A580-17488460A972

Diameter of posterior ocellus: 0.07. Malar line/mandible width: 0.09/0.10. Metatarsus length/width: 0.98/0.26. Metatibia length: 1.17. First segment of metatarsus length: 0.60. Metatibial inner/spur length: 0.28/0.25. T1 length/width at anterior margin/width at posterior margin: 0.50/0.33/0.35. T2 length/width at posterior margin: 0.24/0.48. T3 length: 0.19. Ovipositor sheaths length: 1.3.

**Biology.** Unknown.

**Distribution.** Costa Rica, Guanacaste, ACG (Sector Cacao), 1,460 m.

**Etymology.** Named in honor of Yeimy Cedeño Solís for her enthusiasm in encouraging her Área de Conservación Temisqueque community to understand and protect the wild nature that occurs in her homeland.

### Acknowledgements

The comments from the reviewers (Gavin Broad, Carolina Souza-Gessner) and the editor (Ralph Peters) were especially useful, and are gratefully recognized as helping to improve considerably the final version of the manuscript. Souleymane Nacr (Institut de l’Environnement et de Recherches Agricoles, Burkina Faso) graciously provided JFT with information about the species *Dolicho- genidea oryzae* in Africa. We gratefully acknowledge the unflagging support of the team of ACG parataxonomists and the team of biodiversity managers who protect and manage the ACG forests that host these parasitoids and their caterpillar hosts. The study has been supported by U.S. National Science Foundation grants BSR 9024770 and DEB 9306296, 9400829, 9705072, 0072730, 0515699, and grants from the Wege Foundation, International Conservation Fund of Canada, Jessie B. Cox Charitable Trust, Blue Moon Fund, Guanacaste Dry Forest Conservation Fund, Área de Conservación Guanacaste, Permian Global, individual donors, and University of Pennsylvania. This study has also been supported by the Government of Canada through its ongoing support of the Canadian National Collection, Genome Canada, the Biodiversity Institute of Ontario, the Ontario Genomics Institute, and the Natural Sciences and Engineering Research Council of Canada.
